

E-mobility

for electric cars, busses and ferrys

A well-functioning infrastructure requires maintenance and expansion. That is why we install charging posts for electric cars that give Denmark a head start on an even greener future. We closely follow developments on the market and therefore, in addition to infrastructure for electric cars, we also help roll out infrastructure for both electric buses and ferries.

One partner for planning and implementation

With us, you get one contact person who heads our team, which advises, plans, installs, tests and commissions charging posts and stations for both private and commercial customers. Our call-centre handles the logistics and planning of the installation work, so you get effective execution, regardless of whether you need a few or many installations in your roll-out. At the same time, our technicians across the country offer you service 24/7/365.

Working with the industry leaders

Since 2010, we have installed, tested and commissioned more than 3,000 charging posts across the country for the leading infrastructure providers in the industry. Thanks to our massive know-how and industry expertise, we offer a well-tested concept with consultancy on everything from placement to optimal roll-out. A service contract with us is your guarantee for high uptime and installations that always live up to current legal requirements through maintenance and annual inspections.

In short, we guarantee a solution that you can feel confident in, regardless of whether it is a site with 3.7 or 350 kW.
